Recent North Korean messages, [ ] in-  
dicate the possibility of a planned withdrawal  
of North Korean units to defensive positions  
considerably north of the 38th Parallel. [ ]

[ ] North Korean  
police officials were informed in early March  
that all Communist troops would be with-  
drawn to the 39th Parallel to fight a delaying  
action between that line and the 40th Parallel.  
North Korean military traffic has recently  
been concerned with (a) the movement of  
heavy artillery to a phase line just south of the 39th Parallel on the east  
coast, (b) plans for the removal of supplies from the important forward  
supply base at Kumhwa, near the 38th Parallel, to a town some 25 miles  
farther north, and (c) repeated references to "phase lines" in the rear  
of present positions.

Comment: A temporary enemy withdrawal  
of this nature would possess several tactical advantages, including a  
shortening of supply lines from Manchuria and an exploitation of the  
anticipated effect of weather on future UN operations. The heavy rains,  
beginning in April and reaching a peak in July and August, will seriously  
limit UN air activity and will increase already difficult vehicular move-  
ment on the poor Korean roads.

The possibility of withdrawal of some units  
to the vicinity of the 39th Parallel does not preclude a delaying action  
farther south. US field reports have indicated that North Korean and  
Chinese Communist resistance is continuing along the 38th Parallel,  
and a North Korean message of 17 March referred to "defense of the  
38th Parallel."

5. "Radio rockets" at Pyongyang:

North Korean Military  
23,24 Mar 51  
ACORN

A North Korean Air Force message of 23 March was concerned with the removal of a radio transmitter and "rockets" from Sariwon (30 miles south of Pyongyang) and another unidentified place. One day later the same originator reported that "the radio rockets that were at Sariwon arrived at Pyongyang."

Comment: It is possible that the USSR, in conjunction with the North Korean Air Force, has envisaged realistic service tests of guided missiles in Korea. The evidence is inconclusive as to type, but these "radio rockets" may be surface-to-air (anti-aircraft) missiles (at least two US pilots have recently reported objects with flight characteristics of surface-to-air guided missiles) or, less probably, an air-launched or surface-to-surface missile.
